Preface

This guide to climate zones is an update to Volume 7 in the Best Practices series of guides for home builders produced by the U.S. Department of Energy's Building America Program. This guide describes the climate zone designations used by Building America and compares them with the climate zone designations used in the International Energy Conservation Code (IECC).

Building America welcomes reader feedback on all volumes of the Best Practices Series. Please submit your comments via e-mail to George James (George.James@ee.doe.gov)

Guide to Determining Climate Regions by County

This report describes the climate zone designations used by the U.S. Department of Energy Building America Program. The report is intended as an aid in helping builders to identify the appropriate climate designation for the counties in which they are building. The guide can be used in conjunction with the Best Practices builders' guides produced by the DOE Building America Program to help builders determine which climate-specific Best Practices guide they should use.

The eight U.S. Building America climate regions described here are based on the climate designations used by the International Energy Conservation Code (IECC) and the American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE). The IECC climate zone map was developed by DOE researchers at Pacific Northwest National Laboratory with input from Building America team members, in particular Joseph Lstiburek of Building Science Corporation.^{a,b} The IECC map was developed to provide a simplified, consistent approach to defining climate for implementation of various codes; it was based on widely accepted classifications of world climates that have been applied in a variety of different disciplines. The PNNL-developed map was adopted by the IECC and was first included in the IECC in the 2004 Supplement to the IECC. It first appeared in ASHRAE 90.1 in the 2004 edition. The IECC map divided the United States into eight temperature-oriented climate zones. These zones are further divided into three moisture-oriented moisture regimes designated A, B, and C. Thus the IECC map allows for up to 24 potential climate designations.

In 2003, with direction from the Building America teams, researchers at DOE's National Renewable Energy Laboratory simplified the IECC map for purposes of the Building America Program, into eight climate zones. For reporting purposes, these are further combined into five climate categories: Hot-humid, hot-dry/mixed dry, mixed-humid, marine, cold/very cold, and subarctic.^c

The Building America and IECC climate maps are shown in Figures 1 and 2. The climate regions are described below. Climate zone boundaries follow county boundary lines. A listing of counties comprising each climate zone is provided below, beginning on page 5.

The climate region definitions are based on heating degree days, average temperatures, and precipitation as follows:

The table at the end of this document contains the complete listing of U.S. counties in alphabetical order by state, then county, and then Building America climate region.

^a Briggs RS, ZT Taylor, and RG Lucas. 2003. "Climate Classification for Building Energy Codes and Standards." Presented by Z. Todd Taylor and Robert G. Lucas at ASHRAE Winter Meeting, Chicago, IL on January 28, 2003. PNNL-SA-37941, prepared by Pacific Northwest National Laboratory (PNNL), Richland, WA.

^c Personal communication, Robert Hendron, NREL, 8-18-2010

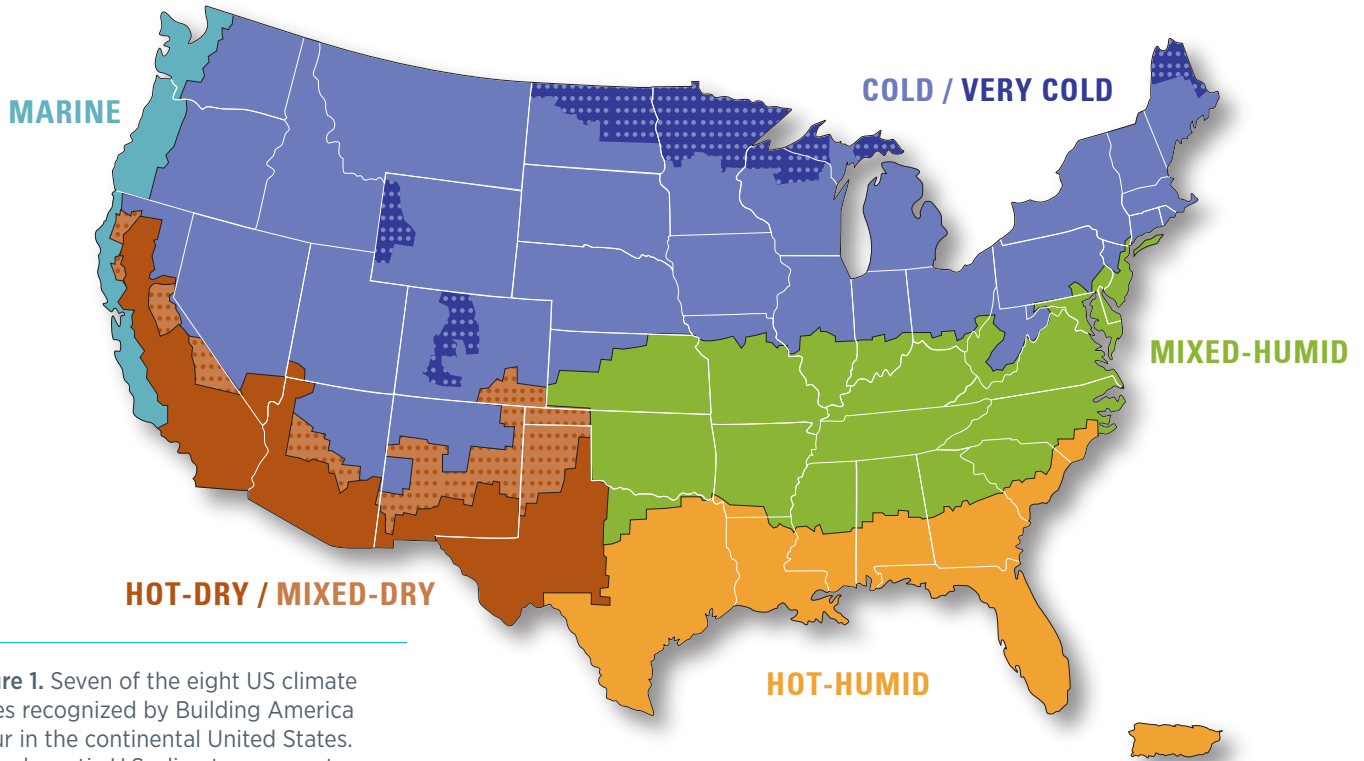

Figure 1. Seven of the eight US climate zones recognized by Building America occur in the continental United States. The sub-arctic U.S. climate zone, not shown on the map, appears only in Alaska.

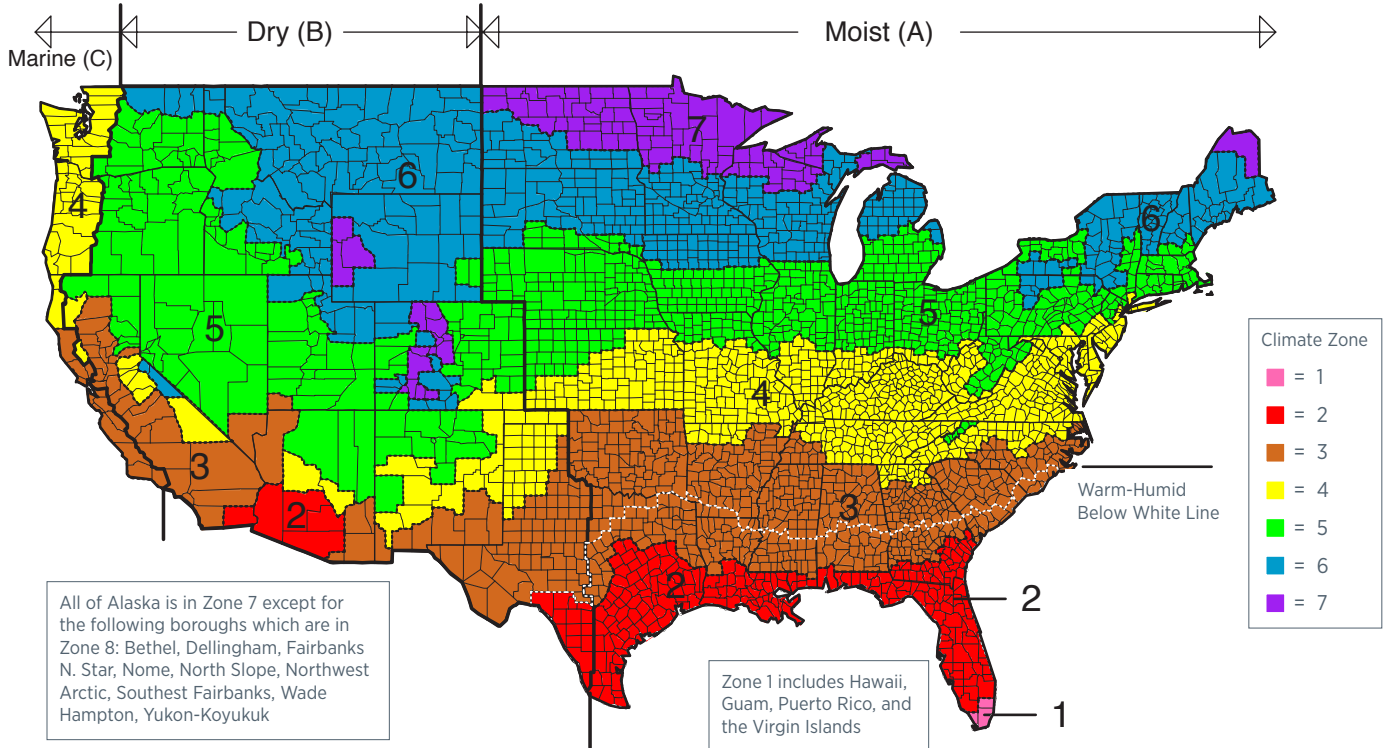

Figure 2. International Energy Conservation Code (IECC) climate regions

Hot-Humid

A hot-humid climate is defined as a region that receives more than 20 inches (50 cm) of annual precipitation and where one or both of the following occur:

- A 67°F (19.5°C) or higher wet bulb temperature for 3,000 or more hours during the warmest six consecutive months of the year; or
- A 73°F (23°C) or higher wet bulb temperature for 1,500 or more hours during the warmest six consecutive months of the year.

The Building America hot-humid climate zone includes the portions of IECC zones 1, 2, and 3 that are in the moist category (A) below the “warm-humid” line shown on the IECC map.

Mixed-Humid

A mixed-humid climate is defined as a region that receives more than 20 inches (50 cm) of annual precipitation, has approximately 5,400 heating degree days (65°F basis) or fewer, and where the average monthly outdoor temperature drops below 45°F (7°C) during the winter months.

The Building America mixed-humid climate zone includes the portions of IECC zones 4 and 3 in category A above the “warm-humid” line.

Hot-Dry

A hot-dry climate is defined as a region that receives less than 20 inches (50 cm) of annual precipitation and where the monthly average outdoor temperature remains above 45°F (7°C) throughout the year.

The Building America hot-dry climate zone corresponds to the portions of IECC zones 2 and 3 in the dry category.

Mixed-Dry

A mixed-dry climate is defined as a region that receives less than 20 inches (50 cm) of annual precipitation, has approximately 5,400 heating degree days (50°F basis) or less, and where the average monthly outdoor temperature drops below 45°F (7°C) during the winter months.

The Building America mixed-dry climate zone corresponds to IECC climate zone 4 B (dry).

Heating Degree Days

The degree-day measurement is the difference in temperature between the mean (average) outdoor temperature over a 24-hour period and a given base temperature for a building space, typically 65°F (25°C in Canada). For example, if the mean temperature at a given location for January 3 is 35°F, then the heating degree days measurement for that day is 30 (65 - 35 = 30).

Building America and IECC Climate Zones

The table below shows the relationship between the Building America and IECC climate zones.

Building America	IECC
Subarctic	Zone 8
Very Cold	Zone 7
Cold	Zones 5 and 6
Mixed-Humid	4A and 3A counties above warm-humid line
Mixed-Dry	Zone 4B
Hot-Humid	2A and 3A counties below warm-humid line
Hot-Dry	Zone 3B
Marine	All counties with a “C” moisture regime

Cold

A cold climate is defined as a region with between 5,400 and 9,000 heating degree days (65°F basis).

The Building America cold climate corresponds to the IECC climate zones 5 and 6.

Very-Cold

A very cold climate is defined as a region with between 9,000 and 12,600 heating degree days (65°F basis).

The Building America very cold climate corresponds to IECC climate zone 7.

Subarctic

A subarctic climate is defined as a region with 12,600 heating degree days (65° basis) or more. The only subarctic regions in the United States are in found Alaska, which is not shown in Figure 1.

The Building America subarctic climate zone corresponds to IECC climate zone 8.

Marine

A marine climate is defined as a region that meets all of the following criteria:

- A coldest month mean temperature between 27°F (-3°C) and 65°F (18°C)
- A warmest month mean of less than 72°F (22°C)
- At least 4 months with mean temperatures higher than 50°F (10°C)
- A dry season in summer. The month with the heaviest precipitation in the cold season has at least three times as much precipitation as the month with the least precipitation in the rest of the year. The cold season is October through March in the Northern Hemisphere and April through September in the Southern Hemisphere.

The Building America marine climate corresponds to those portions of IECC climate zones 3 and 4 located in the “C” moisture category.

Research and Development of Buildings

Our nation's buildings consume more energy than any other sector of the U.S. economy, including transportation and industry. Fortunately, the opportunities to reduce building energy use—and the associated environmental impacts—are significant.

DOE's Building Technologies Program works to improve the energy efficiency of our nation's buildings through innovative new technologies and better building practices. The program focuses on two key areas:

- Emerging Technologies
Research and development of the next generation of energy-efficient components, materials, and equipment
- Technology Integration of new technologies with innovative building methods to optimize building performance and savings
